WARNINGS:
In a coating process with professional products:
- besides the product quality, the final results also depend on numerous other variables, such as environmental conditions; homogeneity in the quality of substrate; the constancy of the application cycle; the plants performance; the proper use of the products, etc.
- in the process of industrial coating a certain waste product is to be considered normal and therefore not attributable to product quality
- the final color is influenced by the preparation of the substrate and the conditions of application; for this reason it is essential to check in advance the result in terms of final use.

HELPFUL HANDLING & MIXING INSTRUCTIONS

FOR GREEN HART, IROKO, CEDAR AND SIMILAR WOODS THAT BLEED:
The use of a solvent base barrier coat is necessary to block the bleeding of tannins on some types of exotic hardwoods and softwoods. Product code TDS500, a two component acrylic solvent base isolator, is recommended.

APPLICATION METHOD:
Klima waterbase products may be applied by spray, brush, and flow coater, in some cases. See the individual item tech data sheet for more information. If retarding is necessary due to high temperature or for flowout or brush application, we recommend using our PX0/03 retarder. Use at 1%-5% in impregnators and 1%-3% in coating products. An alternative retarder is our code TZ88 at 1%-3%. TZ88 is a blend of water/TZ08 at 80/20. Do not apply water base products below 64°F or 16°C.

DRYING:
All waterbase products require good ventilation for drying. The use of fans will dramatically improve dry times during factory application. Do not put finished pieces directly in air flow from the fan while coating is still wet.

Providing sealer and topcoat films are not sticking to the sandpaper, the coatings may be sanded. A good rule of thumb is if you can flick the sandpaper with your finger and all the dust comes off, it is ok to sand. Indications regarding sandpaper sizes are optional. The finer the grit, the smoother the finishes will be. All Klima products will tend to hide sand marks due to their filling properties.

Drying times of Klima coatings will be increased on wood that has poor absorption characteristics and by cold, wet weather. It is always advisable to run short tests with these products to verify if the result obtained is suitable. Wait for a minimum of 3 days before installing factory applied finishes.

If doing an onsite exterior application or if factory applied finishes are installed before completely cured, you may experience white spots or hazing of the film from early exposure to precipitation or cold weather. This is normal and will generally correct itself. Do not touch, but allow the film to dry and reach normal temperature drying conditions.

CROSSLINKER:
TXW02 Crosslinker may be added to any of the Klima products at a level of 1%. It will provide the following benefits:
* Crosslinked properties obtained at room temperature
* Improve chemical, water, alcohol, detergent and abrasion resistance in coatings
* Improve stain and block resistance
* Improve adhesion on difficult to wet substrates

GENERAL INFORMATION:
Do not use steel wool for sanding the raw wood since residual metal dust can cause rust spots.
In the case of exotic and resinous woods, clean the substrate well before coating. For better color uniformity, clean with a dry brush or rag after 15-30 minutes in order to remove excess product not absorbed. When recoating previous coatings, it is best if all of the old film is completely removed by sanding or stripping. Hardwoods usually need a superior number of coats.

RECOMMENDED STORAGE
All water based products should be stored in tightly closed containers at temperatures above 41°F
